                                            The present sequence encodes the mouse antibody 2H7 light chain variable region. Antibody 2H7 is specific for human B-cell antigen. The antibody sequence was used to construct a chimeric human-mouse antibody, in the course of the invention. The chimeric antibody is expressed in a secretion vector comprising a pelB pectate lyase secretion signal peptide. The pelB pectate lyase secretion seguence is useful for producing a protein such as a chimeric antibody in a bacterial host.

The present invention describes a method for preparing an immunoglobulin that is capable of binding antigen involves modular assembly of antibodies through gene cloning and expression of light and heavy chains. The cloned immunoglobulin gene can be produced by expression in

                                                                                                                                                                                                                                                                                                                                                                      ρy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CC genetically engineered organisms. The method comprises: (a) expressing, CC in a bacterial cell, of a first nucleic acid that encodes a bacterial cc signal sequence operably linked to either the heavy chain or heavy chain CC fragment, and a second nucleic acid that encodes a bacterial signal CC sequence operably linked to either the light chain or light chain CC fragment, and obtaining the immunoglobulin from the periplasmic space or CC culture medium; or (b) operably linking a nucleic acid encoding a continue medium; or the light chain variable region or both of the covariable region or the light chain variable region or both of the covariable regions, and obtaining the immunoglobulin from the periplasmic space or culture medium. The bacterial signal sequences bring about the CC variable regions, and obtaining the immunoglobulin from the periplasmic space or culture medium. The bacterial signal sequences bring about the CC space or culture medium. The bacterial signal sequences bring about the CC transport of the heavy chain or heavy chain fragment, or the variable regions through the cytoplasmic cor light chain fragment; or the variable regions through the cytoplasmic cor by a heavy chain variable region and a light chain variable region. The method is useful for producing genetically engineered antibodies of cor desired variable region specificity and constant region properties. The method is also useful large scale production of human antibodies. CC AAH21985 to AAH22082 and AAB98085 to AAB98097 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT7T3 vector. Library is normalized. Library was constructed by Bento Soares and M. Fatima Bonaldo. "a a 113 c 94 g 100 t

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This polypeptide comprises a mouse-human chimeric antibody light chain in which the variable region is derived from mouse anti-human factor IX monoclonal antibody BC2 (see AAM24531) and human sequences from the immunoglobulin RF-TS3 (Cl framework. It can be expressed in transfected mammalian cells utilising a CDNA construct (see AAT79900) obtained by PCR amplification (see AAT79887-98) of BC2 CDNA and insertion of the PCR product into F9HZHC 1-3 CDNA (see AAT77374). Claimed anti-Factor IX chimeric antibodies are useful in the treatment of thrombosis.
                                                                                       Treating post-thromboembolic administering anti-factor IX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; mouse; BC2; animal post-thromboembolic induced ischaemia; thrombolytic agent; anti-factor IX antibody; plasminogen activator; thromboembolic stroke; cerebroprotective; anticoagulant; Thrombolytic; vasotropic; cardiant; anti-respiratory syncytial virus; heavy chain variable region; light chain variable region.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a method for treating an animal post-thromboembolic induced ischaemia or reducing a required dose of a thrombolytic agent in treatment of an animal post-thromboembolic induced ischaemia, comprising administering an anti-factor IX antibody or its fragment, optionally in combination with a plasminogen activator or thrombolytic agent. The method is useful for treating post-thromboembolic-induced ischaemia, for preventing thromboembolic stroke in an animal, and for reducing a required dose of a thrombolytic agent. Sequences AAU80972-AAU81004 represent antibodies and vector polypeptides used in the method of the invention.

They have self-
limiting neutralising activity, and are useful as anticoagulant
agents in treatment of thrombosis associated with myocardial
infarction, unstable angina, atrial fibrillation, stroke, renal
damage, pulmonary embolism, deep vein thrombosis, percutaneous
transluminal coronary angioplasty, disseminated intravascular
coagulation, sepsis, or artificial organs, shunts or prostheses
(claimed). Also claimed are chimeric antibodies (see AAW24532),
Fab and F(ab')2 fragments. The claimed antibodies do not cause
uncontrolled bleeding (contrast heparin and warfarin) since they
provide only partial inhibition of coagulation.
                                                                                                                                                                                                                                                                                                     Human; mouse; BC2; animal post-thromboembolic induced ischaemia;

The method is useful for treating post-thromboembolic-induced ischaemia, for preventing thromboembolic stroke in an animal, and for reducing a required dose of a thrombolytic agent. Sequences AAU80972-AAU81004 represent antibodies and vector polypeptides used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         activator
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 administering anti-factor IX antibody in combination with a plasminogen

                   post-thromboembolic induced ischaemia or reducing a required dose of a thrombolytic agent in treatment of an animal post-thromboembolic induced ischaemia, comprising administering an anti-factor IX antibody or its fragment, optionally in combination with a plasminogen activator or thrombolytic agent. The method is useful for treating post-thromboembolic-induced ischaemia, for preventing thromboembolic stroke in an animal, and for reducing a required dose of a thrombolytic agent. Sequences AAU80972-AAU8104 represent antibodies and vector polypeptides used in the method of the invention.
                                                                                                                                                                                                                                                                                      WPI;

                                                                                                                                       fused with streptavidin, and a cloning site for insertion of a second nucleic acid encoding at least 129 amino acids of streptavidin or its functional variant. The fusion proteins are useful for targeting tumour cells, particularly tumour cells associated with cancer, e.g. adenocarcinomas or hematological malignancies. The vector construct is useful for expressing of streptavidin fusion proteins. In particular, these are useful as tools for medical diagnostics and therapeutic purposes, e.g. for detecting the presence or absence of, or treating, a
                                                                                                                                                                                                                                                                                                                                       The present sequence represents a fusion of an anti-CD20 single chain antibody (BBE9) streptavidin. The fusion protein is expressed using vectors of the invention. The specification describes vector constructs for expressing streptavidin fusion proteins. The vector comprises a nucleic acid encoding streptavidin or its functional variant operatively linked to a promoter, and a cloning site for insertion of a second nucleic acid sequence encoding a polypeptide to be fused with streptavidin, interposed between the promoter and the first nucleic acid sequence. Alternatively, the vector construct comprises a nucleic acid sequence. Alternatively, the vector construct comprises a nucleic acid, operatively linked to a promoter, encoding a polypeptide to be fused with streptavidin and a promoter, encoding a polypeptide to be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New vector constructs for expressing genomic streptavidin fusion proteins which are useful for targeting tumour cells associated with cancer, e.g. adenocarcinomas -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Streptavidin;
